Press Release 10.02.09

Dension Announces total control of visual entertainment in BMW and Porsche

Dension has announced the launch of a new audio visual control unit to be used with BMW professional sat nav and Porsche PCM 2.0 and 2.1 in Cayenne. The AVR works as an accessory to the industry standard iPod interface for MOST vehicles, Gateway 500, and allows the driver to route video signals from iPods, DVD players and many other sources into the original screen in the car and any other screen added (e.g. in the rear head rests).

In short, using the original screen fitted to the car, you can now watch iPod video, DVD, images from reversing camera, games console, or any other visual source fitted to the vehicle. The driver will have total control over which images are displayed on which screen.

Control at your finger tips

Because Dension's goal is to provide simple seamless integration, all the control of the Gateway 500 and the AVR is managed from the original controls of your head unit, the steering wheel controls or the iDrive.

The new products

There are currently two versions of the AVR interface available, the AVR5B1 which works with the BMW professional head unit, and AVR5P1, which is specific to Porsche PCM 2, as fitted in the Cayenne. Work is currently underway to produce compatible interfaces for selected models in the Mercedes and Audi range and details of these will be released nearer the time of their launch.
